## SUMMARY

The transport properties of nitrogen up to 15,000°K are obtained. The nitrogen is assumed to consist of five species; electrons, molecular, ground state atomic, electronically excited atomic, and singly ionized atomic nitrogen. In this work the method of calculation and the results are presented. In part I (1) the collision integrals used in the calculation were presented.

## LIST OF SYMBOLS

$A_{ij}^*$	dimensionless ratio of collision integrals
$B_{ij}^*$	dimensionless ratio of collision integrals
$C_{ij}^*$	dimensionless ratio of collision integrals
$C_v \text{ int}$	internal specific heat of species i
$D_{ij}$	binary diffusion coefficient
$D_{ij}'$	diffusion coefficient
$D_i^T$	effective diffusion coefficient
$D_i^{T,T}$	thermal diffusion coefficient
$d_i$	effective thermal diffusion coefficient
$d_i$	driving "force" for diffusion
$E$	electric field
$E_i$	internal energy per particle of species i
$e$	unit electronic charge
$F_i$	body force on particle of species i
$H_{ij}$	matrix element used in viscosity calculation
$h_i$	enthalpy per particle of species i
$J_i$	diffusive mass flux of species i

j	conduction current
k	Boltzmann constant
$L_{ij}$	Matrix element used in thermal conductivity, diffusion, and thermal diffusion calculations
$M_i$	Molecular weight of species i
$\bar{M}$	average molecular weight
$m_i$	mass of particle of species i
n	total particle density
$n_i$	particle density of species i
p	pressure
$Q^{(\ell)}$	collision cross section of type $\ell$
q	conductive energy flux
R	universal gas constant
T	temperature
$v_i$	diffusion velocity
$v_o$	mass average velocity
$v_i$	average velocity of species i
$x_i$	mole fraction of species i

$Z_i$	number of unit electronic charges per particle of species i
$\delta_{ij}$	Kronecker Delta
$\lambda'$	frozen translational thermal conductivity
$\lambda_{int}$	Eucken-like correction to the thermal conductivity
$\Lambda$	equilibrium reaction thermal conductivity
$\lambda_i$	frozen translational thermal conductivity of a pure gas of species i
$\mu$	viscosity
$\mu_i$	viscosity of a pure gas of species i
$v$	number of species in the gas mixture
$\rho$	density
$\Omega_{ij}^{(\ell, s)}$	collision integral - in square angstroms

## **INTRODUCTION**

**In the previous report on nitrogen transport properties (1) the collision integrals used in the calculation were presented. In this report the method used and the results of the calculation will be presented. A comparison to the results of other workers will be made.**

## METHOD

The transport properties are computed by a Chapman-Enskog solution of the Boltzmann equation (2, 3). The viscosity is computed using the first approximation of the Sonine polynomial expansion while all other transport properties are computed to second approximation. The formalism used to compute the thermal conductivity, diffusion, and thermal diffusion coefficients is a slight variation of the rapid unified method presented in (4, 5). The changes were made to eliminate difficulties that occur when the mole fractions of any of the constituents goes to zero. Recent work by DeVoto (6) summarizes and extends the knowledge of the convergence of the Sonine polynomial expansion for ionized gases. An error due to the use of the first approximation for viscosity will be about 15% for a fully ionized gas, but will be much smaller for a partially ionized gas. For fully ionized gas the errors in the thermal conductivity, diffusion, and thermal diffusion will be 15%, 1%, and 12%, the amount depending on how these quantities are defined.

Using the usual definition of the velocity of the center of mass of a fluid element  $\vec{v}_o$  in terms of the mean velocity of a species  $i$ ,  $\vec{v}_i$

$$(1) \quad \vec{v}_o = \frac{1}{\rho} \sum n_i m_i \vec{v}_i$$

$$(2) \quad \vec{V}_i = \vec{v}_i - \vec{v}_o$$

Following (3) the diffusion velocity is expressed in terms of mixture diffusion coefficients and thermal diffusion coefficients.

$$(3) \quad \vec{v}_i = \frac{1}{x_i} \sum_j \frac{M_j}{\bar{M}} D_{ij} \vec{d}_j - \frac{\bar{M} D_i T}{x_i M_i \rho} \nabla \ell n T$$

where

$$(4) \quad \vec{d}_j = \nabla x_j + x_j (1 - M_j / \bar{M}) \nabla \ell n p - \frac{x_j}{k T} \left[ \vec{F}_j - \frac{M_j}{\bar{M}} \sum_k x_k F_k \right]$$

$$(5) \quad \bar{M} = \sum_k M_k x_k$$

The diffusive mass flux  $J_i$  is

$$(6) \quad \vec{J}_i = n_i m_i \vec{v}_i$$

and the conductive electric current is

$$(7) \quad \vec{j} = e \sum_i n_i \vec{v}_i Z_i$$

$$(8) \quad \vec{q} = -\lambda \nabla T + \sum_i n_i h_i \vec{v}_i - n k T \sum_i \frac{D_i^T d_i}{m_i n_i}$$

Customarily the last term is broken up into a part proportional to the temperature gradient and a part proportional to diffusion velocities. This is convenient for situations in which the diffusion velocities are zero, e.g. a thermal conductivity cell with no chemical reactions. In general, it is believed the eq. 8 is more convenient. A correct development can

be found in (7), while the development in (3) is in error.

The second term strictly is a summation over all quantum states of all chemical species. Electronically excited states can have much larger cross sections than ground states so they should be considered separately. However, it is not practical to consider each vibrational and rotational level of the molecules present as a separate state. If it is assumed that energy is transferred sufficiently rapidly between internal and translational energy the internal states can be assumed in a near Boltzmann distribution at a temperature equal to the translational temperature. The formal generalization of the Chapman-Enskog theory for this case is presented by Monchick, Yun, and Mason (8). In addition, if it is assumed that the cross sections of the various levels are equal, and that inelastic collisions do not perturb the translational distribution function significantly (the quasi-elastic assumption of (8)) the generalized Eucken correction is obtained. The energy flux now includes summations over chemical species.

$$(9) \quad \vec{q} = -\lambda \nabla T - \lambda_{int} \nabla T + \sum n_i h_i \vec{v}_i^* - n k T \sum \frac{D_i^T d_i}{m_i n_i}$$

$$(10) \quad \lambda_{int} = n \sum X_i C_v \text{int} \left[ \sum_j \frac{X_i}{D_{ij}} \right]^{-1}$$

The quantities  $D_{ij}$  are the binary diffusion coefficients

$$(11) \quad \vartheta_{ij} = \frac{.002628 \left[ T^3 (M_i + M_j) / 2 M_i M_j \right]^{1/2}}{p' \Omega^{(1,1)}} \text{ cm}^2 \text{ sec}^{-2}$$

In this dimensional form pressure is in atmospheres, the collision integral in square Angstroms, the temperature in degrees Kelvin.

#### Ambipolar Diffusion

Ambipolar diffusion is defined as the existence of two conditions in an ionized gas, local neutrality, and the absence of electric currents.

$$(12) \quad \sum X_i Z_i = 0$$

$$(13) \quad \sum X_i Z_i \vec{V}_i = 0$$

If the Debye length is short in comparison to the distances in which appreciable changes in the flow take place the ionized gas will tend to be locally neutral. The ionized gas is then said to be a plasma. Outside of regions of rapid change such as shock waves and plasma sheaths around solid bodies the condition is met for gases having an appreciable electron density. If the gas is assumed everywhere locally neutral, then: 1. currents can be passing through the gas between electrodes; 2. there can be closed current loops; or 3. there can be ambipolar diffusion. If we ignore the second possibility in the absence of electrodes there must be ambipolar diffusion. There can be no current loops in spherically symmetric,

cylindrically symmetric, and planar problems.

In ambipolar diffusion a self induced electric field is generated to prevent the electrons from diffusing faster than the ions. In the absence of other body forces the force on a particle and the resultant electric field are

$$(14) \quad \vec{F}_j = e \vec{E} Z_j$$

$$(15) \quad E = \frac{\sum \sum Z_i M_j D_{ij} \vec{d}_j - \sum \frac{Z_i \bar{M}^2}{M_i \rho} D_i^T \nabla \ln T}{\sum \sum \frac{e_i Z_j}{k T} M_j X_j D_{ij}}$$

If the electric field, eq. 15, is substituted into eq. 3, after some simple algebra involving changing the order of the summations, we obtain

$$(16) \quad \vec{V}_i = \frac{1}{X_i} \sum_j \frac{M_j}{M} D'_{ij} \vec{d}'_j - \frac{\bar{M} D'_i^T \nabla \ln T}{X_i M_i \rho}$$

$$(17) \quad d'_j = \nabla X_j + X_j \left[ 1 - \frac{M_j}{\bar{M}} \right] \nabla \ln p$$

$$(18) \quad D'_{ij} = D_{ij} - \frac{\sum_a M_a X_a D_{ia} Z_a \sum_b D_{bj} Z_b}{\sum_a \sum_b Z_a Z_b D_{ab} X_b M_b}$$

$$(19) \quad D'_i^T = D_i^T - \frac{\sum_a M_a D_{ia} X_a Z_a \sum \frac{Z_a}{M_a} D_a^T}{\sum_a \sum_b Z_a Z_b M_b D_{ab} X_b}$$

The quantities  $D'_{ij}$  and  $D_i^T$  can be thought of as effective diffusion and thermal diffusion coefficients respectively. In problems involving ambipolar diffusion their use is recommended (5). It should be noted that the  $D'_{ii}$  are not zero as the  $D_{ii}$  are. At vanishing degrees of ionization the interdiffusion of the neutral species and the energy flux will have the same value if computed by effective or ordinary diffusion and thermal diffusion coefficients. However, the corresponding individual coefficients do not become identical.

### Viscosity

The first approximation to the viscosity of a gas mixture is given by

$$(20) \quad \mu = \sum X_i b_{i0}$$

where  $b_{i0}$  is the solution of the linear system

$$(21) \quad \begin{aligned} H_{11} b_{10} + H_{12} b_{20} + \dots + H_{12} b_{20} &= X_1 \\ \vdots &\quad \vdots \quad \vdots \quad \vdots \\ H_{21} b_{10} + H_{22} b_{20} + \dots + H_{22} b_{20} &= X_2 \end{aligned}$$

with matrix elements

$$H_{ii} = \frac{x_i^2}{\mu_i} + \frac{2RTX_i}{p} \sum \frac{x_k}{(M_i + M_k)} \delta_{ik} \left[ 1 + \frac{3}{5} \frac{M_k}{M_i} A_{ik}^* \right]$$

$$H_{ij} = - \frac{2x_i x_j}{(M_i + M_j)} \frac{RT}{p} \delta_{ij} \left[ 1 - \frac{3}{5} A_{ij}^* \right] \quad i \neq j$$

The viscosity of a pure gas of species  $i$  to first approximation is,

$$(22) \quad \mu_i = \frac{2.669 \times 10^{-5} [M_i T]^{1/2}}{\Omega^{(2,2)}}$$

Usually the diagonal matrix elements are much larger in absolute value than the off diagonal elements so that the linear system eq. 21 can be approximately solved by an expansion. Using only the first three terms we obtain the approximate formula

$$(23) \quad \mu = \frac{x_i^2}{H_{ii}} - \sum_i \sum_{j \neq i} \frac{x_i x_j H_{ij}}{H_{ii} H_{jj}} + \sum_i \sum_{j \neq i} \sum_{k \neq i} \frac{x_j x_k H_{ij} H_{ik}}{H_{ii} H_{jj} H_{kk}}$$

Eq. 23 is much simpler to evaluate than eqs. 20 and 21. However, in some instances it was shown not to be accurate.

The viscosity will not be effected by the changes in the  $Q^{(1)}$  cross section of the  $N - N$ \* interaction caused by excitation exchange. For want of better knowledge all the other cross sections of the excited nitrogen atoms are taken as being equal to the ground state nitrogen atom. Hence for the viscosity the explicit differentiation of ground state and excited nitrogen atoms has no effect on the final result.

## Diffusion, Thermal Diffusion, and Thermal Conductivity

The diffusion coefficients  $D_{ij}$ , the thermal diffusion coefficients  $D_i^T$ , and the frozen translational thermal conductivity  $\lambda'$ , are obtained simultaneously in a formalism due to Sherman (4, 5). We will use a square matrix composed of four quadrants, each of  $v \times v$  elements, where  $v$  is the number of species. The matrix is nearly identical to that of (3), but is divided by  $X_j$  to avoid numerical difficulties that would occur as some of the mole fractions approach zero.

$$\begin{array}{cccc} L_{11}^{00} & \dots & L_{1v}^{00} & L_{11}^{01} \\ \cdot & & \cdot & \cdot \\ L_{v1}^{00} & \dots & L_{vv}^{00} & L_{v1}^{01} \end{array} \quad \begin{array}{cccc} & & & L_{1v}^{01} \\ & & & \cdot \\ & & & L_{vv}^{01} \end{array}$$

$$\begin{array}{cccc} L_{11}^{10} & \dots & L_{1v}^{10} & L_{11}^{11} \\ \cdot & & \cdot & \cdot \\ L_{v1}^{10} & \dots & L_{vv}^{10} & L_{v1}^{11} \end{array} \quad \begin{array}{cccc} & & & L_{1v}^{11} \\ & & & \cdot \\ & & & L_{vv}^{11} \end{array}$$

$$(24) \quad L_{ii}^{00} = 0$$

$$L_{ij}^{00} = \frac{16T}{25p} \left[ \frac{x_i}{\vartheta_{ij}} + \frac{M_j}{M_i} \sum_{k \neq i} \frac{x_k}{\vartheta_{ik}} \right] \quad i \neq j$$

$$L_{ii}^{01} = \frac{8T}{5p} \sum_{k \neq i} \frac{x_k M_k \left( \frac{6}{5} C_{ik}^* - 1 \right)}{(M_i + M_k) \vartheta_{ik}}$$

$$L_{ij}^{01} = - \frac{8T}{5p} \frac{x_i M_i \left( \frac{6}{5} C_{ij}^* - 1 \right)}{(M_i + M_j) \vartheta_{ij}} \quad i \neq j$$

$$L_{ij}^{10} = \frac{M_j}{M_i} L_{ij}^{01}$$

$$L_{ii}^{11} = - \frac{16T}{25p} \left[ \frac{2x_i A_{ii}^*}{\vartheta_{ii}} + \right.$$

$$\left. \frac{\sum_{k \neq i} x_k \left[ \frac{15}{2} M_i^2 + \frac{25}{4} M_k^2 - 3 M_k^2 B_{ik} + 4 M_i M_k A_{ik}^* \right]}{(M_i + M_k)^2 \vartheta_{ik}} \right]$$

$$L_{ij}^{11} = \frac{16T}{25p} \frac{x_i M_i M_j}{(M_i + M_j)^2 \vartheta_{ij}} \left[ \frac{55}{4} - 3 B_{ij}^* - 4 A_{ij}^* \right] \quad i \neq j$$

$$\text{where } A_{ij}^* = \overline{\Omega_{ij}^{(2,2)}} / \overline{\Omega_{ij}^{(1,1)}}$$

$$B_{ij}^* = \left[ 5 \overline{\Omega_{ij}^{(1,2)}} - 4 \overline{\Omega_{ij}^{(1,3)}} \right] / \overline{\Omega_{ij}^{(1,1)}}$$

$$C_{ij}^* = \overline{\Omega_{ij}^{(1,2)}} / \overline{\Omega_{ij}^{(1,1)}}$$

$$(25) \quad \lambda' = -4 \sum a_{i1}$$

$$(26) \quad D_i^T = \frac{8}{5} - \frac{M_i}{R} a_{i0}$$

The  $a_{ij}$  are the unknowns in the linear system

$$(27) \quad L_{11}^{00} a_{10} + \dots + L_{1\nu}^{00} a_{\nu 0} + L_{11}^{01} a_{11} + \dots + L_{1\nu}^{01} a_{\nu 1} = 0$$

$$\begin{matrix} \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \end{matrix}$$

$$L_{\nu 1}^{00} a_{10} + \dots + L_{\nu \nu}^{00} a_{\nu 0} + L_{\nu 1}^{01} a_{11} + \dots + L_{\nu \nu}^{01} a_{\nu 1} = 0$$

$$L_{11}^{10} a_{10} + \dots + L_{1\nu}^{10} a_{\nu 0} + L_{11}^{11} a_{11} + \dots + L_{1\nu}^{11} a_{\nu 1} = x_1$$

$$\begin{matrix} \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \end{matrix}$$

$$L_{\nu 1}^{10} a_{10} + \dots + L_{\nu \nu}^{10} a_{\nu 0} + L_{\nu 1}^{11} a_{11} + \dots + L_{\nu \nu}^{11} a_{\nu 1} = x_\nu$$

or in more compact notation

$$(28) \quad \vec{L} \cdot \vec{a} = \vec{R}$$

The diffusion coefficients are obtained using the same matrix but with a different inhomogenous vector.

$$(29) \quad D_{ij} = \frac{16 T}{25 p} \frac{\bar{M}}{M_j} C_{i0}^{(j, i)}$$

$$(30) \quad \vec{L} \cdot \vec{C}^{(j, i)} = \vec{S}^{(j, i)}$$

$$(31) \quad \vec{S}^{(j, i)} = \begin{bmatrix} \delta_{1j} - \delta_{-i} \\ \delta_{2j} - \delta_{2i} \\ \delta_{\nu j} - \delta_{\nu i} \\ 0 \\ \vdots \\ 0 \end{bmatrix}$$

where  $\delta_{1j} = \begin{cases} 1 & i=j \\ 0 & i \neq j \end{cases}$

The first approximation to the diffusion coefficients would be obtained by just using the (0, 0) quadrant to obtain the  $C_{i0}$ , while the first approximation to the frozen thermal conductivity would be obtained by just using the (1, 1) quadrant to obtain the  $a_{i1}$ . The equations are most readily solved by inverting the L matrix. The matrix is sufficiently well behaved so that standard matrix inversion routines using single precision arithmetic were satisfactory. The unknowns are then obtained by matrix vector multiplication.

The diffusion coefficients and the thermal diffusion coefficients must obey certain consistency relations obtained from eq. 3 and irreversible thermodynamics (3).

$$(32) \quad D_{ij} = D_{ji} + \sum_{\substack{k \neq i \\ k \neq j}} M_k \left[ \frac{D_{ki}}{M_j} - \frac{D_{kj}}{M_i} \right]$$

$$(33) \quad \sum_i D_i^T = 0$$

$$(34) \quad X_j \left[ - \bar{M} M_j D_{ij} + \sum_{k \neq i} X_k M_k^2 D_{ik} \right] \\ = X_i \left[ - \bar{M} M_i D_{ji} + \sum_{k \neq j} X_k^2 M_k^2 D_{jk} \right]$$

It is now possible to define an "equilibrium reaction thermal conductivity" for a constant pressure process in which the composition is in equilibrium and is only a function of temperature. Ambipolar diffusion is assumed.

$$\Lambda \equiv - \frac{q}{\nabla T} \\ = \lambda' + \lambda_{int} - \frac{5}{2} p \sum_i \sum_j \frac{M_j}{M} D'_{ij} \frac{dX_j}{dT} - n \sum_i E_i \sum_j \frac{M_j}{M} D'_{ij} \frac{dX_j}{dT} \\ + \frac{5}{2} R \sum_i \frac{D'_i T}{M_i} + \frac{R}{kT} \sum_i \frac{E_i D'_i T}{M_i} \\ + R T \sum_i \frac{D'_i T}{M_i X_i} \frac{dX_i}{dT} \\ - \frac{eR}{k} E \sum_i \frac{D'_i T Z_i}{M_i}$$

The self induced electric field of the last term is given by eq. 15.

A few checks indicated that the last four terms, the thermal diffusion terms, made only a slight contribution.

## RESULTS

### Viscosity

The qualitative behavior of the viscosity as shown in Fig. 1. is readily explicable. At the lowest temperatures considered the nitrogen is nearly all molecular nitrogen and the viscosity of this one component gas is independent of pressure. As the nitrogen dissociates there is a modest rise in the viscosity as compared to less dissociated nitrogen at the same temperature but higher pressure since the collision integral of atomic nitrogen is less than the molecular. As the gas ionizes, the viscosity drops drastically. Electrons, because of their small mass, do not contribute significantly to the viscosity, and the contribution of the ions is much less than the neutrals because of the large Coulomb cross section. At the highest temperatures and pressures considered, the gas is nearly fully singly ionized and the viscosity begins to rise with the expected 5/2 power temperature dependence.

The only results on the viscosity of high temperature nitrogen that this author has found are that of Yos (9). Yos considers hydrogen, oxygen, nitrogen, and air, up to 30,000 °K at 1, 3, 10, and 30 atmospheres. However, his transport property formulas are much more approximate than those used in this work. Yos and the present results agree at the lower temperatures, but the value of the viscosity as given by Yos is up to 50% higher at temperatures near 15,000 °K.

### Thermal Conductivity

The frozen translational thermal conductivity is shown in Fig. 2. The curves are very roughly similar in shape to the viscosity curves for similar physical reasons. In contrast to the viscosity, the contribution to the frozen translational thermal conductivity of the electrons is not small. The ion contribution is always negligible.

Fig. 3. shows the sum of the frozen translational thermal conductivity and the Eucken-like correction for the different internal energy levels of the molecule. When all the molecules are dissociated, the curves become identical to those of Fig. 2.

Fig. 4. shows the "equilibrium effective thermal conductivity" for an equilibrium gas at constant pressure with ambipolar diffusion. The values are considerably larger than those of Figs. 2 and 3 because of the diffusive fluxes of dissociative and ionization energy with their energy release. All the thermal diffusion effects are small. In Fig. 5, excitation exchange between excited and ground state nitrogen atoms is ignored. This results in an apparent increase in the effective thermal conductivity by no more than about ten percent in some regions and in negligible effects at low temperatures, and at high temperatures and low pressures. The assumption of Fig. 4, that the excitation exchange cross section is equal to the charge exchange cross section, and the complete neglect of excitation exchange in Fig. 5 represent probable upper and lower bounds. Clearly a four species model of nitrogen combining all neutral nitrogen atoms is fairly accurate, at least near equilibrium.

Yos (9) presents values of equilibrium effective thermal conductivity and the frozen translational thermal conductivity with the Eucken-like correction. At low temperatures both sets of values are in good agreement, but above 10,000°K the equilibrium effective thermal conductivity of Yos is up to 40% higher than the present values. The frozen translational thermal conductivity is nowhere in disagreement by more than 20%.

Burhorn (10) calculated the effective thermal conductivity and obtained results in poor agreement with this paper. He shows a peak of roughly  $6 \times 10^5$  erg/cm-sec. K at 7,000°K compared to  $4 \times 10^5$  at about 8,000 K. At higher temperatures Burhorn is too low by about 30%. Both the Yos and Burhorn methods of computing transport properties are not as exact as the present method.

#### Diffusion and Thermal Diffusion

The diffusion and effective diffusion coefficients are to be found in the tables together with the binary diffusion coefficients.

ACKNOWLEDGEMENTS

Mr. J. W. Massey did the bulk of the programming for the digital computer. Mr. V. Kirk and Mr. T. Tocci helped in the numerical work. Mr. L. Gilbert was of great assistance. The manuscript was typed by Mrs. M. F. Riba.

This work was supported in part by NASA under Contract NASr-32.

<b>SUMMARY</b>  The transport properties of nitrogen up to 15,000°K are obtained. The nitrogen is assumed to consist of five species; electrons, molecular, ground state atomic, electronically excited atomic, and singly ionized atomic nitrogen. In this work the method of calculation and the results are presented. In part I (1) the collision integrals used in the calculation were presented.		
<b>KEY WORDS</b> Transport Properties, Nitrogen, Viscosity, Thermal Conductivity, Diffusion
